MICROCHIP

24AA00/24LC00/24C00

128-Bit I^{2}C™ Bus Serial EEPROM

Device Selection Table

| Device	Vcc Range	Temp Range
24AA00	1.7-5.5	I
24LC00	2.5-5.5	I
24C00	4.5-5.5	I,E

Features:

- Single supply with operation down to 1.7V for 24AA00 devices, 2.5V for 24LC00 devices
- Low-power CMOS technology:
  - Read current 500 μA, typical
  - Standby current 100 nA, typical
- 2-wire serial interface, I^{2}C™ compatible
- Schmitt Trigger inputs for noise suppression
- Output slope control to eliminate ground bounce
- 100 kHz and 400 kHz clock compatibility
- Page write time 3 ms, typical
- Self-timed erase/write cycle
- ESD protection >4000V
- More than 1 million erase/write cycles
- Data retention >200 years
- Factory programming available
- Packages include 8-lead PDIP, SOIC, TSSOP, DFN and 5-lead SOT-23
- Pb-free and RoHS compliant
- Temperature ranges available:
  - Industrial (I):   -40°C to +85°C
 - Automotive (E): -40°C to +125°C

Description:

The Microchip Technology Inc. 24AA00/24LC00/24C00 (24XX00*) is a 128-bit Electrically Erasable PROM memory organized as 16 x 8 with a 2-wire serial interface. Low-voltage design permits operation down to 1.7 volts for the 24AA00 version, and every version maintains a maximum standby current of only 1 μA and typical active current of only 500 μA. This device was designed for where a small amount of EEPROM is needed for the storage of calibration values, ID numbers or manufacturing information, etc. The 24XX00 is available in 8-pin PDIP, 8-pin SOIC (3.90 mm), 8-pin TSSOP, 8-pin 2x3 DFN and the 5-pin SOT-23 packages.

*24XX00 is used in this document as a generic part number for the 24AA00/24LC00/24C00 devices.

Package Types
Block Diagram
Pin Function Table

Name	Function
Vss	Ground
SDA	Serial Data
SCL	Serial Clock
Vcc	+1.7V to 5.5V (24AA00)
	+2.5V to 5.5V (24LC00)
	+4.5V to 5.5V (24C00)
NC	No Internal Connection

I^{2}C is a trademark of Philips Corporation.

24AA00/24LC00/24C00

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings[†]

VCC...6.5V

All inputs and outputs w.r.t. VSS .... -0.6V to VCC +1.0V

Storage temperature ....-65°C to +150°C

Ambient temperature with power applied..-40°C to +125°C

ESD protection on all pins .... 4 kV

> † NOTICE: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.
TABLE 1-1: DC CHARACTERISTICS

All Parameters apply across the recommended operating ranges unless otherwise noted	Industrial (I): TA = -40°C to +85°C, VCC = 1.8V to 5.5V Automotive (E) TA = -40°C to +125°C, VCC = 4.5V to 5.5V				
Parameter	**Symbol**	**Min.**	**Max.**	**Units**	**Conditions**
SCL and SDA pins:					
High-level input voltage	VIH	0.7 VCC	—	V	**(Note)**
Low-level input voltage	VIL	—	0.3 VCC	V	**(Note)**
Hysteresis of Schmitt Trigger inputs	VHYS	.05 VCC	—	V	VCC ≥ 2.5V **(Note)**
Low-level output voltage	VOL	—	0.4	V	IOL = 3.0 mA, VCC = 4.5V IOL = 2.1 mA, VCC = 2.5V
Input leakage current	ILI	—	±1	µA	VIN = VCC or VSS
Output leakage current	ILO	—	±1	µA	VOUT = VCC or VSS
Pin capacitance (all inputs/outputs)	CIN, COUT	—	10	pF	VCC = 5.0V **(Note)** TA = 25°C, FCLK = 1 MHz
Operating current	ICC Write	—	2	mA	VCC = 5.5V, SCL = 400 kHz
	ICC Read	—	1	mA	VCC = 5.5V, SCL = 400 kHz
Standby current	ICCS	—	1	µA	VCC = 5.5V, SDA = SCL = VCC

Note: This parameter is periodically sampled and not 100% tested.

SDA and SCL fall time	T_F	—	300	ns	**(Note 1)**
Start condition hold time	$T_{HD:STA}$	4000 4000 600	— — —	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Start condition setup time	$T_{SU:STA}$	4700 4700 600	— — —	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Data input hold time	$T_{HD:DAT}$	0	—	ns	**(Note 2)**
Data input setup time	$T_{SU:DAT}$	250 250 100	— — —	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Stop condition setup time	$T_{SU:STO}$	4000 4000 600	— — —	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Output valid from clock **(Note 2)**	T_{AA}	— — —	3500 3500 900	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Bus free time: Time the bus must be free before a new transmission can start	T_{BUF}	4700 4700 1300	— — —	ns	4.5V ≤ Vcc ≤ 5.5V (E Temp range) 1.7V ≤ Vcc ≤ 4.5V 4.5V ≤ Vcc ≤ 5.5V
Output fall time from V_{IH} minimum to V_{IL} maximum	T_{OF}	20+0.1 CB	250	ns	**(Note 1)**, CB ≤ 100 pF
Input filter spike suppression (SDA and SCL pins)	T_{SP}	—	50	ns	**(Notes 1, 3)**
Write cycle time	T_{WC}	—	4	ms	
Endurance		1M	—	cycles	**(Note 4)**

Note 1:   Not 100% tested. C_B = total capacitance of one bus line in pF.

   2:   As a transmitter, the device must provide an internal minimum delay time to bridge the undefined region (minimum 300 ns) of the falling edge of SCL to avoid unintended generation of Start or Stop conditions.

   3:   The combined T_{SP} and V_{HYS} specifications are due to new Schmitt Trigger inputs which provide improved noise spike suppression. This eliminates the need for a TI specification for standard operation.

   4:   This parameter is not tested but ensured by characterization. For endurance estimates in a specific application, please consult the Total Endurance™ Model which can be obtained at www.microchip.com.

24AA00/24LC00/24C00

2.0   PIN DESCRIPTIONS

2.1   SDA Serial Data

This is a bidirectional pin used to transfer addresses and data into and data out of the device. It is an open drain terminal, therefore the SDA bus requires a pull-up resistor to V_{CC} (typical 10 kΩ for 100 kHz, 2 kΩ for 400 kHz).

For normal data transfer SDA is allowed to change only during SCL low. Changes during SCL high are reserved for indicating the Start and Stop conditions.

2.2   SCL Serial Clock

This input is used to synchronize the data transfer from and to the device.

2.3   Noise Protection

The SCL and SDA inputs have Schmitt Trigger and filter circuits which suppress noise spikes to assure proper device operation even on a noisy bus.

3.0   FUNCTIONAL DESCRIPTION

The 24XX00 supports a bidirectional 2-wire bus and data transmission protocol. A device that sends data onto the bus is defined as a transmitter, and a device receiving data as a receiver. The bus has to be controlled by a master device which generates the Serial Clock (SCL), controls the bus access, and generates the Start and Stop conditions, while the 24XX00 works as slave. Both master and slave can operate as transmitter or receiver, but the master device determines which mode is activated.

4.0   BUS CHARACTERISTICS

The following **bus protocol** has been defined:

* Data transfer may be initiated only when the bus is not busy.
* During data transfer, the data line must remain stable whenever the clock line is high. Changes in the data line while the clock line is high will be interpreted as a Start or Stop condition.

Accordingly, the following bus conditions have been defined (Figure 4-1).

4.1   Bus Not Busy (A)

Both data and clock lines remain high.

4.2   Start Data Transfer (B)

A high-to-low transition of the SDA line while the clock (SCL) is high determines a Start condition. All commands must be preceded by a Start condition.

4.3   Stop Data Transfer (C)

A low-to-high transition of the SDA line while the clock (SCL) is high determines a Stop condition. All operations must be ended with a Stop condition.

4.4   Data Valid (D)

The state of the data line represents valid data when, after a Start condition, the data line is stable for the duration of the high period of the clock signal.

The data on the line must be changed during the low period of the clock signal. There is one bit of data per clock pulse.

Each data transfer is initiated with a Start condition and terminated with a Stop condition. The number of the data bytes transferred between the Start and Stop conditions is determined by the master device and is theoretically unlimited.

4.5 Acknowledge

Each receiving device, when addressed, is obliged to generate an acknowledge after the reception of each byte. The master device must generate an extra clock pulse which is associated with this Acknowledge bit.

Note: The 24XX00 does not generate any Acknowledge bits if an internal programming cycle is in progress.

The device that acknowledges has to pull down the SDA line during the Acknowledge clock pulse in such a way that the SDA line is stable low during the high period of the acknowledge related clock pulse. Of course, setup and hold times must be taken into account. A master must signal an end of data to the slave by not generating an Acknowledge bit on the last byte that has been clocked out of the slave. In this case, the slave must leave the data line high to enable the master to generate the Stop condition (Figure 4-2).

FIGURE 4-1: DATA TRANSFER SEQUENCE ON THE SERIAL BUS
FIGURE 4-2: ACKNOWLEDGE TIMING
24AA00/24LC00/24C00

5.0 DEVICE ADDRESSING

After generating a Start condition, the bus master transmits a control byte consisting of a slave address and a Read/Write bit that indicates what type of operation is to be performed. The slave address for the 24XX00 consists of a 4-bit device code '1010' followed by three "don't care" bits.

The last bit of the control byte determines the operation to be performed. When set to a one a read operation is selected, and when set to a zero a write operation is selected (Figure 5-1). The 24XX00 monitors the bus for its corresponding slave address all the time. It generates an Acknowledge bit if the slave address was true and it is not in a programming mode.

FIGURE 5-1: CONTROL BYTE FORMAT
6.0 WRITE OPERATIONS

6.1 Byte Write

Following the Start signal from the master, the device code (4 bits), the "don't care" bits (3 bits), and the R/W bit (which is a logic low) are placed onto the bus by the master transmitter. This indicates to the addressed slave receiver that a byte with a word address will follow after it has generated an Acknowledge bit during the ninth clock cycle. Therefore, the next byte transmitted by the master is the word address and will be written into the Address Pointer of the 24XX00. Only the lower four address bits are used by the device, and the upper four bits are "don't cares." The 24XX00 will acknowledge the address byte and the master device will then transmit the data word to be written into the addressed memory location. The 24XX00 acknowledges again and the master generates a Stop condition. This initiates the internal write cycle, and during this time the 24XX00 will not generate Acknowledge signals (Figure 7-2). After a byte Write command, the internal address counter will not be incremented and will point to the same address location that was just written. If a Stop bit is transmitted to the device at any point in the Write command sequence before the entire sequence is complete, then the command will abort and no data will be written. If more than 8 data bits are transmitted before the Stop bit is sent, then the device will clear the previously loaded byte and begin loading the data buffer again. If more than one data byte is transmitted to the device and a Stop bit is sent before a full eight data bits have been transmitted, then the Write command will abort and no data will be written. The 24XX00 employs a V_{CC} threshold detector circuit which disables the internal erase/write logic if the V_{CC} is below 1.5V (24AA00 and 24LC00) or 3.8V (24C00) at nominal conditions.

7.0   ACKNOWLEDGE POLLING

Since the device will not acknowledge during a write cycle, this can be used to determine when the cycle is complete (this feature can be used to maximize bus throughput). Once the Stop condition for a Write command has been issued from the master, the device initiates the internally timed write cycle. ACK polling can be initiated immediately. This involves the master sending a Start condition followed by the control byte for a Write command (R/$\overline{W}$ = 0). If the device is still busy with the write cycle, then no ACK will be returned. If no ACK is returned, then the Start bit and control byte must be re-sent. If the cycle is complete, then the device will return the ACK and the master can then proceed with the next Read or Write command. See Figure 7-1 for flow diagram.

FIGURE 7-1:   ACKNOWLEDGE POLLING FLOW
FIGURE 7-2:   BYTE WRITE
24AA00/24LC00/24C00

8.0   READ OPERATIONS

Read operations are initiated in the same way as write operations with the exception that the R/$\overline{W}$ bit of the slave address is set to one. There are three basic types of read operations: current address read, random read and sequential read.

8.1   Current Address Read

The 24XX00 contains an address counter that maintains the address of the last word accessed, internally incremented by one. Therefore, if the previous read access was to address n, the next current address read operation would access data from address n + 1. Upon receipt of the slave address with the R/$\overline{W}$ bit set to one, the device issues an acknowledge and transmits the eight-bit data word. The master will not acknowledge the transfer, but does generate a Stop condition and the device discontinues transmission (Figure 8-1).

8.2   Random Read

Random read operations allow the master to access any memory location in a random manner. To perform this type of read operation, first the word address must be set. This is done by sending the word address to the device as part of a write operation.

After the word address is sent, the master generates a Start condition following the acknowledge. This terminates the write operation, but not before the internal Address Pointer is set. Then the master issues the control byte again, but with the R/$\overline{W}$ bit set to a one. The 24XX00 will then issue an acknowledge and transmits the eight bit data word. The master will not acknowledge the transfer, but does generate a Stop condition and the device discontinues transmission (Figure 8-2). After this command, the internal address counter will point to the address location following the one that was just read.

8.3   Sequential Read

Sequential reads are initiated in the same way as a random read except that after the device transmits the first data byte, the master issues an acknowledge as opposed to a Stop condition in a random read. This directs the device to transmit the next sequentially addressed 8-bit word (Figure 8-3).

To provide sequential reads the 24XX00 contains an internal Address Pointer which is incremented by one at the completion of each read operation. This Address Pointer allows the entire memory contents to be serially read during one operation.

Microchip Technology Drawing C04-091B

APPENDIX A: REVISION HISTORY

Revision E

Added DFN package.

Revision F (02/2007)

Revised Device Selection Table; Features Section; Changed 1.8V to 1.7V; Revised Tables 1-1, 1-2; Revised Product ID System; Replaced Package Drawings; Replaced On-line Support page.

Revision G (03/2007)

Replaced Package Drawings (Rev. AM).

NOTES:

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com, click on Customer Change Notification and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support
- Development Systems Information Line

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://support.microchip.com

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

To: Technical Publications Manager   Total Pages Sent _____

RE: Reader Response

From: Name _____

Company _____

Address _____

City / State / ZIP / Country _____

Telephone: (_____) _____ - _____   FAX: (_____) _____ - _____

Application (optional):

Would you like a reply?____Y ____N

Device: 24AA00/24LC00/24C00   Literature Number: DS21178G

Questions:

1. What are the best features of this document?

   _____
   _____

2. How does this document meet your hardware and software development needs?

   _____
   _____

3. Do you find the organization of this document easy to follow? If not, why?

   _____
   _____

4. What additions to the document do you think would enhance the structure and subject?

   _____
   _____

5. What deletions from the document could be made without affecting the overall usefulness?

   _____
   _____

6. Is there any incorrect or misleading information (what and where)?

   _____
   _____

7. How would you improve this document?

   _____
   _____

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X	/XX
Device	Temperature Range	Package

Device:
24AA00: = 1.7V, 128 bit I^{2}C™ Serial EEPROM
24AA00T: = 1.7V, 128 bit I^{2}C Serial EEPROM (Tape and Reel)
24LC00: = 2.5V, 128 bit I^{2}C Serial EEPROM
24LC00T: = 2.5V, 128 bit I^{2}C Serial EEPROM (Tape and Reel)
24C00: = 5V, 128 bit I^{2}C™ Serial EEPROM
24C00T: = 5V, 128 bit I^{2}C™ Serial EEPROM (Tape and Reel)

Temperature Range:
I = -40°C to +85°C
E = -40°C to +125°C

Package:
P = Plastic DIP (300 mil body), 8-lead
SN = Plastic SOIC (3.90 mm body), 8-lead
ST = Plastic TSSOP (4.4 mm), 8-lead
OT = SOT-23, 5-lead (Tape and Reel only)
MC = 2x3 DFN, 8-lead

Examples:

a) 24AA00-I/P: Industrial Temperature, 1.8V PDIP package

b) 24AA00-I/SN: Industrial Temperature, 1.8V, SOIC package

c) 24AA00T-I/OT: Industrial Temperature, 1.8V, SOT-23 package, tape and reel

d) 24LC00-I/P: Industrial Temperature, 2.5V, PDIP package

e) 24C00-E/SN: Extended Temperature, 5V, SOIC package

f) 24LC00T-I/OT: Industrial Temperature, 2.5V, SOT-23 package, tape and reel

NOTES:

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.

- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.

- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.

- Microchip is willing to work with the customer who is concerned about the integrity of their code.

- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
